SAFE INSTALLATION, USE AND SERVICE

Your safety and the safety of others is extremely important in the installation, use, and servicing of this water heater.

Many safety-related messages and instructions have been provided in this manual and on your own water heater to warn you and others of a potential injury hazard. Read and obey all safety messages and instructions throughout this manual. It is very important that the meaning of each safety message is understood by you and others who install, use, or service this water heater.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or injury.

WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or injury.

CAUTION indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury.

CAUTION used without the safety alert symbol indicates a potentially hazardous situation which, if not avoided, could result in property damage.

All safety messages will generally tell you about the type of hazard, what can happen if you do not follow the safety message and how to avoid the risk of injury.

The California Safe Drinking Water and Toxic Enforcement Act requires the Governor of California to publish a list of substances known to the State of California to cause cancer, birth defects, or other reproductive harm, and requires businesses to warn of potential exposure to such substances.

• WARNING: This product contains a chemical known to the State of California to cause cancer, birth defects, or other reproductive harm.
• This appliance can cause low-level exposure to some of the substances listed in the act.

IMPORTANT DEFINITION

• Qualified Technician: A qualified technician must have ability equivalent to a licensed tradesman in the fields of plumbing, and electrical installation of these appliances. This would include a thorough understanding of the requirements of the National Electrical Code and applicable local electrical and plumbing codes (and tools necessary to confirm proper installation and operation of the water heater) as they relate to the installation of electric water heaters. The qualified technician must have a thorough understanding of the water heater instruction manual.
GENERAL SAFETY

WARNING
Read and understand this instruction manual and safety messages before installing, operating, or servicing this water heater.
Failure to follow these instructions and safety messages could result in death or serious injury.
This manual must remain with water heater.

CAUTION
Improper installation and use may result in property damage.

- Do not operate water heater if flood damaged.
- Inspect and replace anode.
- Install in location with drainage.
- Fill tank with water before operation.
- Be alert for thermal expansion.
Refer to this manual for installation and service.

WARNING
Explosion Hazard

- Overheated water can cause water tank explosion.
- Properly sized temperature and pressure relief valve must be installed in opening provided.

WARNING

- Before removing any access panels or servicing the water heater, make sure the electrical supply to the water heater is turned “OFF.”
- Failure to do this could result in death, serious bodily injury, or property damage.

DANGER
Water temperature over 125°F (52°C) can cause severe burns instantly resulting in severe injury or death.
Children, the elderly, and the physically or mentally disabled are at highest risk for scald injury.
Feel water before bathing or showering.
Temperature limiting valves are available.
Read this instruction manual for safe temperature setting.

WARNING
Fire Hazard / Electric Shock Hazard

- Do not use this water heater with any voltage other than shown on the model rating plate.
- Failure to use the correct voltage shown on the model rating plate could result in death, serious bodily injury, or property damage.
INTRODUCTION

Thank You for purchasing this water heater. Properly installed and maintained, it should give you years of trouble free service.

Abbreviations Found In This Instruction Manual:
- ANSI - American National Standards Institute
- ASME - American Society of Mechanical Engineers
- AHRI - Air Conditioning, Heating and Refrigeration Institute
- NEC - National Electrical Code
- NFPA - National Fire Protection Association
- UL - Underwriters Laboratories Inc.

PREPARING FOR THE INSTALLATION

1. Read the “General Safety” section of this manual first and then the entire manual carefully. If you don’t follow the safety rules, the water heater will not operate properly. It could cause DEATH, SERIOUS BODILY INJURY, AND/OR PROPERTY DAMAGE.

This manual contains instructions for the installation, operation, and maintenance of the electric water heater. It also contains warnings throughout the manual that you must read and understand. All warnings and all instructions are essential to the proper operation of the water heater and your safety. **READ THE ENTIRE MANUAL BEFORE ATTEMPTING TO INSTALL OR OPERATE THE WATER HEATER.**

2. The installation must conform with these instructions and the local code authority having jurisdiction and the requirements of the power company. In the absence of local code requirements follow NFPA-70, the National Electrical Code (current edition), which may be ordered from: National Fire Protection Association, 1 Batterymarch Park, Quincy, MA 02269.

3. If after reading this manual you have any questions or do not understand any portion of the instructions, call the local utility or the manufacturer whose name appears on the rating plate.

4. Carefully plan your intended placement of the water heater. **INSTALLATION OR SERVICE OF THIS WATER HEATER REQUIRES ABILITY EQUIVALENT TO THAT OF A LICENSED TRADESMAN IN THE FIELD INVOLVED. PLUMBING AND ELECTRICAL WORK ARE REQUIRED.**

Examine the location to ensure the water heater complies with the “Facts to Consider About the Location” section in this manual.

5. For California installation this water heater must be braced, anchored, or strapped to avoid falling or moving during an earthquake. See instructions for correct installation procedures. Instructions may be obtained from California Office of the State Architect, 1102 Q Street, Suite 5100, Sacramento, CA 95814. Instructions can also be downloaded to your computer at www.dsa.dgs.ca.gov/Pubs.

6. Massachusetts Code requires this water heater to be installed in accordance with Massachusetts 248-CMR 2.00: State Plumbing Code and 248-CMR 5.00.
TYPICAL INSTALLATION

Uprights/lowboys

† Fused electrical supply

Hot water supply pipe

Union

Electrical junction box adjacent conduit entrance

Emblem plate

Cold water inlet line

Shutoff valve

3/4" threaded connection

† Temperature and pressure relief valve opening may be on side or top of heater. See "Temperature and Pressure Relief Valve" section.

Discharge pipe (do not cap or plug)

Access panels

Rating plate

Max. Air gap

Floor drain

Metal drain pan

Install thermal expansion tank or device if water heater is installed in a closed water system.

† Electrical connections may be located on the top or side. Refer to your unit. Actual model and illustration may vary dependent on model capacity and type. Some models have alternate inlet, outlet and T&P valve locations. These alternate locations are identified by the labeling on the unit.

Rating plate

Max. Air gap

Access panels

Discharge pipe (do not cap or plug)

Floor drain

Cold water inlet line

Drain valve

Install with suitable metal drain pan that is piped to an adequate drain.

6" (15.2 cm) Maximum Air Gap

Install thermal expansion tank or device if water heater is installed in a closed water system.

Install suitable metal drain pans under heaters to prevent damage due to leakage. Refer to water heater location, see "Installing the New Water Heater" section.

FIGURE 1.
There are typically two different types of installation. The installation section of this manual has been broken into these two methods:

Look at your old water heater installation to determine which type of installation you have. After finding out what type of installation you have, look at these options:

**Section A**

**Galvanized Pipe or Copper (Sweat) Piping**

The original piping is galvanized pipe or sweat copper and you are going to use a “Water Heater Installation Kit”.

**Installation Kit** or **Individual Parts**

- **Flexible Water connectors with 3/4” Pipe Nipples** Part No. 9000060
- **3/4” Connector Fittings** Part No. 9000062
- **1/2” to 3/4” Reducer Bushing** Part No. 9000258
- **1/2” Connector Fittings** Part No. 9000061

**Electric Installation Kit** Part No. 9000104

**Check Your Tools**

- **SLOT-HEAD SCREWDRIVER**
- **PHILLIPS SCREWDRIVER**
- **PIPE WRENCH**
- **PIPEDOPE (STICK) OR ROLL OF TEFLON TAPE**
- **GARDEN HOSE**

**Section B**

**Copper (Sweat) Piping**

The original piping is copper sweat and you are going to reconnect with sweat joints.

- **Electrical Wiring Kit** Part No. 9000076
- **Roll of Teflon Tape**
- **Pipe Dope (Stick)**
- **2-3” Nipples (Use Dielectric Fittings when available)**
- **1 3/4” Male Threaded to Sweat Connectors**
- **2 3/4” Female Threaded to Sweat Connectors**
- **1 - 90° Sweat Elbow**
- **2 - Sweat Couplings**

**Length of Hard Copper Piping** (Size of copper pipe and sweat fittings must be the same size as the original piping.)

**Check Your Tools**

- **SLOT-HEAD SCREWDRIVER**
- **3/4” (19 mm) WIRE BRUSH**
- **PHILLIPS SCREWDRIVER**
- **1/2” (13 mm) WIRE BRUSH**
- **TUBING CUTTER**
- **ROLL OF LEAD-FREE SOFT SOLDER**
- **PIPE WRENCH**
- **SOLDER FLUX**
- **ROLL OF EMERY CLOTH**
- **GARDEN HOSE**
- **PROPANE TORCH**

Now that you have decided which method you are going to use, follow the removal Steps 1 through 5 on Page 7.
1. Turn “OFF” electrical supply to the water heater.

2. Turn “OFF” the water supply to the water heater at the water shut-off valve or water meter.

3. Attach a hose to the water heater drain valve and put the other end in a floor drain or outdoors. Open the water heater drain valve. Open a nearby hot water faucet which will relieve pressure in the water heater and speed draining.

4. Check again to make sure the electrical supply is turned “OFF” to the water heater. Then disconnect the electrical supply connection from the water heater junction box. See Figure 2.

5. a. If you have copper piping to the water heater, the two copper water pipes can be cut with a hacksaw approximately 4” away from where they connect to the water heater. See Figure 3. This will avoid cutting off the pipes too short. Additional cuts can be made later if necessary. Disconnect the temperature-pressure relief valve drain line. When the water heater is drained, disconnect the hose from the drain valve. Close the drain valve. The water heater is now completely disconnected and ready to be removed.

   FIGURE 2.

   FIGURE 3.

   b. If you have galvanized pipe to the water heater, loosen the two galvanized pipes with a pipe wrench at the union in each line. See Figure 4. Also disconnect the piping remaining to the water heater. These pieces should be saved since they may be needed when reconnecting the new water heater. Disconnect the temperature-pressure relief valve drain line. When the water heater is drained, disconnect the hose from the drain valve. Close the drain valve. The water heater is now completely disconnected and ready to be removed.

   FIGURE 4.

Note: Mineral buildup or sediment may have accumulated in the old water heater. This causes the water heater to be much heavier than normal and this residue, if spilled out, could cause staining.
**MIXING VALVE USAGE**

**Water (Potable) Heating:** All models are considered suitable for water (potable) heating only.

*HOTTER WATER CAN SCALD:*

Water heaters are intended to produce hot water. Water heated to a temperature which will satisfy space heating, clothes washing, dish washing, and other sanitizing needs can scald and permanently injure you upon contact. Some people are more likely to be permanently injured by hot water than others. These include the elderly, children, the infirm, or physically/mentally disabled. If anyone using hot water in your home fits into one of these groups or if there is a local code or state law requiring a certain temperature water at the hot water tap, then you must take special precautions. In addition to using the lowest possible temperature setting that satisfies your hot water needs, a means such as a mixing valve should be used at the hot water taps used by these people or at the water heater. Mixing valves are available from your local plumbing contractor. Consult a qualified technician. Follow mixing valve manufacturer’s instructions for installation of the valves. Before changing the factory setting on the thermostat, read the “Temperature Regulation” section in this manual.

**LOCATING THE NEW WATER HEATER**

**FACTS TO CONSIDER ABOUT THE LOCATION**

**CAUTION**

*Property Damage Hazard*

- All water heaters eventually leak
- Do not install without adequate drainage.

Carefully choose an indoor location for the new water heater, because the placement is a very important consideration for the safety of the occupants in the building and for the most economical use of the appliance.

Whether replacing an old water heater or putting the water heater in a new location, the following critical points must be observed:

1. Select a location indoors as close as practical or centralized to the water piping system as possible. The water heater should be located in an area not subject to freezing temperatures.

2. Selected location must provide adequate clearances (4") for servicing parts such as the thermostats, drain valve, and relief valve. Adequate clearance for servicing this appliance should be considered before installation, such as changing the anodes, etc.
3. The water heater should be located so it is not subject to physical damage by moving vehicles or area flooding.

Installation of the water heater must be accomplished in such a manner that if the tank or any connections should leak, the flow will not cause damage to the structure. For this reason, it is not advisable to install the water heater in an attic or upper floor. When such locations cannot be avoided, a suitable metal drain pan should be installed under the water heater. Metal drain pans are available from your local plumbing contractor. Such a metal drain pan must have a minimum length and width of at least 2 inches (51 mm) greater than the water heater dimensions and must be piped to an adequate drain.

Water heater life depends upon water quality, water pressure and the environment in which the water heater is installed. Water heaters are sometimes installed in locations where leakage may result in property damage, even with the use of a metal drain pan piped to a drain. However, unanticipated damage can be reduced or prevented by a leak detector or water shut-off device used in conjunction with a piped metal drain pan. These devices are available from some plumbing supply wholesalers and retailers, and detect and react to leakage in various ways:

- Sensors mounted in the metal drain pan that trigger an alarm or turn off the incoming water to the water heater when leakage is detected.
- Sensors mounted in the metal drain pan that turn off the water supply to the entire home when water is detected in the metal drain pan.

**INSTALLING THE NEW WATER HEATER**

**WATER PIPING**

**DANGER**

Water temperature over 125°F (52°C) can cause severe burns instantly resulting in severe injury or death. Children, the elderly, and the physically or mentally disabled are at highest risk for scald injury. Feel water before bathing or showering. Temperature limiting valves are available. Read this instruction manual for safe temperature setting.

**HOTTER WATER CAN SCALD:**

Water heaters are intended to produce hot water. Water heated to a temperature which will satisfy space heating, clothes washing, dish washing, cleaning and other sanitizing needs can scald and permanently injure you upon contact. Some people are more likely to be permanently injured by hot water than others. These include the elderly, children, the infirm, or physically/mentally disabled. If anyone using hot water in your home fits into one of these groups or if there is a local code or state law requiring a certain temperature water at the hot water tap, then you must take special precautions. In addition to using the lowest possible temperature setting that satisfies your hot water needs, a means such as a mixing valve should be used at the hot water taps used by these people or at the water heater. Valves for reducing point of use temperature by mixing cold and hot water are also available.

Consult a qualified technician. Follow manufacturer’s instructions for installation of the valves. Before changing the factory setting on the thermostat, read the “Temperature Regulation” section in this manual.

**WARNING**

Toxic Chemical Hazard

- Do not connect to non-potable water system.

This water heater shall not be connected to any heating systems or component(s) used with a non-potable water heating appliance.

Use properly sized water heaters for spa or hot tub use.

Toxic chemicals, such as those used for boiler treatment shall not be introduced into this system.

Water supply systems may, because of such events as high line pressure, frequent cut-offs, the effects of water hammer among others, have installed devices such as pressure reducing valves, check valves, back flow preventers, etc. to control these types of problems. When these devices are not equipped with an internal by-pass, and no other measures are taken, the devices cause the water system to be closed. As water is heated, it expands (thermal expansion) and closed systems do not allow for the expansion of heated water.

The water within the water heater tank expands as it is heated and increases the pressure of the water system. If the relieving point of the water heater’s temperature-pressure relief valve is reached, the valve will relieve the excess pressure. The temperature-pressure relief valve is not intended for the constant relief of thermal expansion. This is an unacceptable condition and must be corrected.

It is recommended that any devices installed which could create a closed system have a by-pass and/or the system have an expansion tank or device to relieve the pressure built by thermal expansion in the water system. Expansion tanks are available for ordering through a local plumbing contractor. Contact the local water supplier and/or a qualified technician for assistance in controlling these situations.
Some compact models have labeled optional plumbing connections, see Table 1.

**WARNING**

**Explosion Hazard**

- Models with optional Top Hot Outlet or T&P location are identified as EITHER Hot Outlet or T&P.
- Models with optional installation locations on jacket top can NOT be installed with both Hot Outlet and T&P located on top.
- Never attempt to use Cold Outlet on jacket top as Hot Outlet or T&P.
- Connections should only be used as identified on heater. Failure to use them properly could result in damage to the water heater, serious bodily injury, or death.

### SECTION A: USING THE INSTALLATION KIT

1. Position the water heater so that the existing piping and electrical hookup will require the shortest distance between connections. Make sure that you are able to reach the drain valve and all access panels when the water heater is in place. See Figure 6. This will make it easy to service the water heater. The water heater must be level before you begin the piping.

   If a water heater is installed in a closed water supply system such as one having a back-flow preventer, check valve, water meter with a check valve, etc., in the cold water supply, then means shall be provided to control thermal expansion. Contact the water supplier or plumbing contractor on how to control this situation.

2. Wrap the 3/4" nipples with teflon tape or pipe joint compound and screw into the water heater where it’s marked “HOT” and “COLD.” See Figure 7. Wrap the other ends of nipples with Teflon tape or pipe joint compound and screw one end of each flexible water connector onto each nipple.

3. If your home has 1/2" or 3/4" copper piping to the water heater, use the correct size compression fittings to connect both flexible water connector to existing copper pipes. Connect fittings to existing piping first. If your home has 3/4" galvanized piping to the water heater, simply apply Teflon tape or pipe joint compound to the ends of the galvanized pipes and screw flexible connector onto the pipes. See Figure 8.

4. Check that all connections are tight and that the drain valve near the bottom of the water heater is closed. When you are finished, complete the following sections in this order: “Filling the Water Heater,” then “Wiring.”

---

Factory Supplied on Some Models

1. Locate the temperature and pressure relief valve on the water heater (also known as a T&P relief valve). See Figure 9.
2. Locate the slit running the length of the T&P relief valve insulation.
3. Spread the slit open and fit the insulation over the T&P relief valve. See Figure 9. Apply gentle pressure to the insulation.
to ensure that it is fully seated on the T&P Relief Valve. Once seated, secure the insulation with duct tape, electrical tape, or equivalent. IMPORTANT: The insulation and tape must not block the discharge opening or hinder access to the manual relief lever (Figure 9). Ensure a discharge pipe is installed into the T&P valve discharge opening per the instructions in this manual.

4. Locate the hot water (outlet) & cold water (inlet) pipes to the water heater.

5. Locate the slit running the length of a section of pipe insulation.

6. Spread the slit open and slip the insulation over the cold water (inlet) pipe. Apply gentle pressure along the length of the insulation to ensure that it is fully seated around the pipe. Also, ensure that the base of the insulation is flush with the water heater. Once seated, secure the insulation with duct tape, electrical tape, or equivalent.

7. Repeat steps 5 and 6 for the hot water (outlet) pipe.

8. Add additional sections of pipe insulation as needed.

SECTION B: USING THE (SWEAT) SOLDERING METHOD

1. Position the water heater so that the existing piping and electrical hookup will require the shortest distance between connections. Make sure that you are able to reach the drain valve and all access panels when the water heater is in place. See Figure 10. This will make it easy to service the water heater. The water heater must be level before you begin the piping.

2. The pipe cutter is simple to use, screw the adjustment knob until the opening of the jaws will allow the cutters to be placed around the pipe. Then close the adjustment until the cutting blade is just tight against the pipe. Do not over tighten. Make one or two revolutions of the cutter around the pipe. Tighten the adjustment knob slightly, and revolve the cutters around the pipe once again. Continue this procedure until the pipe is completely cut in two.

3. Using the diagram, map out the installation. Screw the nipples into the tank and the fittings onto the nipples, hand tight. See Figure 11. Then measure and cut the copper tubing. Remove the nipples and fittings, then go to the next step.

4. Put two or three turns of Teflon tape or pipe joint compound around both the threaded end of the 3/4" x 3" nipples, and using a pipe wrench, tighten the nipples into the “HOT” and “COLD” fittings on the water heater. See Figure 7.

5. Cleaning and brushing the piping and fittings is one of the most important aspects of sweat connections. Clean the ends of each piece of copper with emery cloth. See Figure 12. Clean the inside of each sweat fitting with a wire brush as shown. Make sure you do not touch the cleaned areas.

6. The 3/4" female threaded to sweat connectors and two pieces of copper pipe to connect the water heater to the house plumbing should be cleaned, fluxed and assembled. See Figure 11. Do not screw the connectors into the nipples in the tank before soldering.

7. Solder pipe/connector assembly. When solder flows into and completely around the joint, you should remove the solder and the heat immediately.

8. Using your pipe wrench, secure the pipe/connector assemblies onto the nipples.

9. Flux the ends of piping and inside the couplings.

10. Put the pipes and coupling together, and solder. Solder the top first, and then quickly solder the bottom.

11. Flux the ends of the length of pipe cut for the T & P and the inside of the 3/4" male threaded to sweat connector and 90° sweat elbow. See Figure 13. Then solder this assembly together. Do not screw the connector into the Temperature Pressure Relief Valve before the assembly is soldered together.
12. Using your pipe wrench, screw the assembly into the Temperature-Pressure Relief Valve. See Figure 13.

13. Flux the inside of the 90° elbow and the length of pipe to be run to an adequate drain, and solder them together. See Figure 14.

14. Check that all connections are tight and that the drain valve near the bottom of the water heater is closed. When you are finished, complete the following sections in this order: “Filling the Water Heater,” then “Wiring.”

NOTE: To protect against untimely corrosion of hot and cold water fittings, it is strongly recommended that di-electric unions or couplings be installed on this water heater when connected to copper pipe.

Figure 15 shows the typical attachment of the water piping to the water heater. The water heater is equipped with 3/4 inch NPT water connections.

NOTE: If using copper tubing, solder tubing to an adapter before attaching the adapter to the cold water inlet connection. Do not solder the cold water supply line directly to the cold water inlet, it will harm the dip tube and damage the tank.

OPTIONAL INSTALLATION INSTRUCTIONS FOR COMPACT MODELS

Some compact models have optional plumbing connections. On these units, if top connection is preferred over the side connection, use the following instructions as they apply to your connection:

To change Temperature and Pressure (T&P) valve location: Remove 3/4” plug from opening in jacket top. Replace 3/4” plug opening with T&P valve; plug original T&P valve opening with 3/4” plug. **BE SURE TO REAPPLY PIPE JOINT COMPOUND OR TEFLOM TAPE AROUND THE THREADED ENDS OF THE TEMPERATURE AND PRESSURE (T&P) RELIEF VALVE AND THE 3/4” PLUG WHEN REINSTALLING COMPONENTS.**

To change Cold Inlet location: Remove 3/4” plug from opening in jacket top. Replace 3/4” plug opening with Cold Inlet nipple; plug original Cold Inlet opening with 3/4” plug. **BE SURE TO REAPPLY PIPE JOINT COMPOUND OR TEFLOM TAPE AROUND THE THREADED ENDS OF THE COLD INLET NIPPLE AND THE 3/4” PLUG WHEN REINSTALLING COMPONENTS.**

To change Hot Outlet location: Screw 3/4” NPT galvanized cap (not included, purchase locally) onto Side Hot Outlet and install 3/4” NPT nipple (not included, purchase locally) in the opening identified as HOT/T&P location. **BE SURE TO REAPPLY PIPE JOINT COMPOUND OR TEFLOM TAPE AROUND THE THREADED ENDS OF THE 3/4” NPT NIPPLES WHEN REINSTALLING COMPONENTS.**
This heater is provided with a properly certified combination temperature - pressure relief (T&P) valve by the manufacturer.

The T&P valve is certified by a nationally recognized testing laboratory that maintains periodic inspection of production of listed equipment of materials as meeting the requirements for Relief Valves for Hot Water Supply Systems, ANSI Z21.22 • CSA 4.4, and the code requirements of ASME.

If replaced, the T&P valve must meet the requirements of local codes, but not less than a combination temperature and pressure relief valve certified as indicated in the above paragraph.

The T&P valve must be marked with a maximum set pressure not to exceed the marked hydrostatic working pressure of the water heater (150 psi = 1,035 kPa) and a discharge capacity not less than the water heater input rate as shown on the model rating plate.

For safe operation of the water heater, the temperature and pressure relief valve must not be removed from its designated opening nor plugged.

The temperature-pressure relief valve must be installed directly into the fitting of the water heater designed for the relief valve. Position the valve downward and provide piping so that any discharge will exit only within 6 inches above an adequate drain, or external to the building or structure. Be certain that no contact is made with any live electrical part. The discharge opening must not be blocked or reduced in size under any circumstances. Excessive length, over 30 feet (9.14 m), or use of more than four elbows can cause restriction and reduce the discharge capacity of the temperature and pressure relief valve.

No valve or other obstruction is to be placed between the relief valve and the tank. Do not connect pipe directly to discharge drain unless a 6 inch air gap is provided. The relief valve must be allowed to discharge water in sufficient quantities, should circumstances demand, to prevent bodily injury, hazard to life, or property damage. If the discharge pipe is not connected to a drain or other suitable means, the water flow may cause property damage.
If after manually operating the valve, it fails to completely reset and continues to release water, immediately close the cold water inlet to the water heater, follow the draining instructions, and replace the temperature-pressure relief valve with a new one.

**FILLING THE WATER HEATER**

**CAUTION**

Property Damage Hazard

- Avoid water heater damage.
- Fill tank with water before operating.

Never use this water heater unless it is completely full of water. To prevent damage to the tank and heating element, the tank must be filled with water. Water must flow from the hot water faucet before turning “ON” electrical supply to the water heater. The manufacturer will not warrant any elements damaged by failure to follow instructions.

To fill the water heater with water:

1. Close the water heater drain valve by turning the handle to the right (clockwise). The drain valve is on the lower front of the water heater.

2. Open the cold water supply valve to the water heater.

   **NOTE:** The cold water supply valve must be left open when the water heater is in use.

3. To ensure complete filling of the tank, allow air to exit by opening the nearest hot water faucet. Allow water to run until a constant flow is obtained. This will let air out of the water heater and the piping.

4. Check all water piping and connections for leaks. Repair as needed.

5. Never alter or modify the certified construction of the water heater or its components, or bypass any safety features. Doing so voids all warranties.

**WATER PIPING PRESSURE TEST**

This section is only for the manufacturer installing the water heater when the installation is to comply with H.U.D. Standards.

When testing the water ways, H.U.D. Standards state: “Water distribution system: All water piping in the water distribution system shall be subjected to a pressure test. The test shall be made by subjecting the system to air or water at 100 psi for 15 minutes without loss of pressure. When air pressure is used, the water heater shall not be connected during the test.”

---

**WARNING**

Air Pressure Hazard

- If water piping system is to be air pressure tested, the water heater must be disconnected from the water piping system.
- Failure to disconnect the water heater during air pressure testing of the water system could result in DEATH, SERIOUS BODILY INJURY, OR PROPERTY DAMAGE.
WIRING DIAGRAMS

FOR ACTUAL WIRING CIRCUIT OF UNIT - REFERENCE CIRCUIT TYPE LISTED ON RATING PLATE.

P-4
120/208/240/277/416/480 VOLT SIMULTANEOUS OPERATION 3 PHASE UNBALANCED SIMULTANEOUS

Both circuits protected by Hi-Limit Switch. For 3 phase systems, separate black wires and provide 3 phase power source. Note: 120V and 277V wired for single phase only.

A-6
TWO WIRE CIRCUIT FOR NON-SIMULTANEOUS OPERATION, HAS SINGLE HIGH LIMIT CONTROL

C-2
STANDARD SINGLE ELEMENT 120 VOLT & 277 VOLT

A-9
"OFF PEAK" NON-SIMULTANEOUS OPERATION BOTTOM ELEMENT ON SEPARATE TIME CLOCK OR "OFF PEAK" METER

C-2
STANDARD SINGLE ELEMENT 208, 240, AND 480 VOLT

NOTE: Some lower Hi-Temp Limit Switches may have 4 terminals, use only the 2 terminals on left.

† 120V and 277 will have white wire in place of red.

Maximum Allowable Simultaneous Operation:
5000/5000 Watts at 208 volts 5500/5500 Watts at 240 volts. Any wattage usage higher than listed above exceeds allowable amp draw and will cause damage to the water heater or could result in fire.

FIGURE 18.
Never use water heater unless it is completely full of water. To prevent damage to the tank and heating element, the tank must be filled with water. Water must flow from the hot water faucet before turning on power.

You must provide all wiring of the proper size outside of the water heater. You must obey local codes and electric company requirements when you install this wiring.

If you are not familiar with electric codes and practices, or if you have any doubt, even the slightest doubt, in your ability to connect the wiring to this water heater, obtain the service of a competent electrician. Contact a local electrical contractor and/or the local electric utility.

WATER HEATERS EQUIPPED FOR ONE VOLTAGE ONLY: This water heater is equipped for one type voltage only. Check the rating plate near the bottom access panel for the correct voltage. DO NOT use this water heater with any voltage other than the one shown on the model rating plate. Failure to use the correct voltage can cause problems which can result in DEATH, SERIOUS BODILY INJURY, OR PROPERTY DAMAGE. If you have any questions or doubts consult your electric company.

If wiring from your fuse box or circuit breaker box was aluminum for your old water heater, replace it with copper wire. If you wish to reuse the existing aluminum wire, have the connection at the water heater made by a competent electrician. Contact a local electrical contractor and/or the local electric utility.

1. Provide a way to easily shut off the electric power when working on the water heater. This could be with a circuit breaker or fuse block in the entrance box or a separate disconnect switch.

2. Install and connect a circuit directly from the main fuse or circuit breaker box. This circuit must be the right size and have its own fuse or circuit breaker.

3. If metal conduit is used for the grounding conductor:
   A. The grounding electrode conductor shall be of copper, aluminum, or copper clad aluminum. The material shall be of one continuous length without a splice or joint.
   B. Rigid metal conduit, intermediate metal conduit, or electrical, metallic tubing may be used for the grounding means if conduit or tubing is terminated in fittings approved for grounding.
   C. Flexible metal conduit or flexible metallic tubing shall be permitted for grounding if all the following conditions are met:
      • The length in any ground return path does not exceed 6 feet.
      • The circuit conductors contained therein are protected by overcurrent devices rated at 20 amperes or less.
      • The conduit or tubing is terminated in fittings approved for grounding.

For complete grounding details and all allowable exceptions, refer to the current edition of the National Electrical Code NFPA 70.

4. A standard 1/2" conduit opening has been made in the water heater junction box for the conduit connections.

5. Use wire nuts and connect the power supply wiring to the wires inside the water heater’s junction box.

6. The water heater must be electrically "grounded" by the installer. A green ground screw has been provided on the water heater’s junction box. Connect ground wire to this location.

7. Replace the wiring junction cover using the screw provided.

FIGURE 19.

INSTALLATION CHECKLIST

1. Is the fuse or circuit breaker size correct? See "Wiring" in the "Installing the New Water Heater" section.

2. Are the wires from the circuit breaker or fuse service to the water heater’s junction box the correct wire size (gauge)?

3. Is the new temperature-pressure relief valve properly installed, and piped to an adequate drain? See "Temperature-Pressure Relief Valve" section.

5. Will a water leak damage anything? See “Locating the New Water Heater” section.

6. Are the cold and hot water lines connected to the water heater correctly? See “Water Piping” in the “Installing the New Water Heater” section.

7. Is there adequate clearance for maintenance around the water heater?

8. Do you need to call an electrical contractor and/or the local electric company to check your wiring?
HOTTER WATER CAN SCALD: Water heaters are intended to produce hot water. Water heated to a temperature which will satisfy space heating, clothes washing, dish washing, and other sanitizing needs can scald and permanently injure you upon contact. Some people are more likely to be permanently injured by hot water than others. These include the elderly, children, the infirm, or physically/mentally disabled. If anyone using hot water in your home fits into one of these groups or if there is a local code or state law requiring a certain temperature water at the hot water tap, then you must take special precautions. In addition to using the lowest possible temperature setting that satisfies your hot water needs, a means such as a mixing valve, should be used at the hot water taps used by these people or at the water heater. Mixing valves are available from your local plumbing contractor. Follow manufacturer’s instructions for installation of the valves. Before changing the factory setting on the thermostat, see Figure 19.

Never allow small children to use a hot water tap or to draw their own bath water. Never leave a child or handicapped person unattended in a bathtub or shower.

It is recommended that lower water temperatures be used to avoid the risk of scalding. It is further recommended, in all cases, that the water temperature thermostat be set for the lowest temperature which satisfies your hot water needs. This will also provide the most energy efficient operation of the water heater. Thermostat(s) are factory set at 120°F (49°C) unless specified differently by state requirements.

KEEPING THE THERMOSTAT SETTING AT 120°F (49°C) WILL REDUCE THE RISK OF SCALDS.

Figure 19 shows the approximate time-to-burn relationship for normal adult skin.

TEMPERATURE ADJUSTMENT

To change the temperature setting:

NOTE: It is not necessary to adjust the upper thermostat. However, if it is adjusted above the factory set point (120°F (49°C)) it is recommended that it not be set higher than the lower thermostat setting.

1. Turn off the heater electrical supply. Do not attempt to adjust thermostat with power on.
2. Remove the thermostat access panels and covers from the thermostats. Do not remove the plastic personnel protectors covering the thermostats.
3. Using a flat tip screwdriver, rotate the adjustment knob to the desired temperature setting.
4. Replace the covers and access panels and turn on heater electrical supply.

TEMPERATURE SETTINGS

It is recommended that the dial be set lower whenever possible.

**FIGURE 20.**
THERMAL EXPANSION

As water is heated, it expands (thermal expansion). In a closed system, the volume of water will grow. As the volume of water grows, there will be a corresponding increase in water pressure due to thermal expansion. Thermal expansion can cause premature tank failure (leakage). This type of failure is not covered under the limited warranty. Thermal expansion can also cause intermittent temperature-pressure relief valve operation: water discharged from the valve due to excessive pressure build up. The temperature-pressure relief valve is not intended for the constant relief of thermal expansion. This condition is not covered under the limited warranty.

A properly-sized thermal expansion tank should be installed on all closed systems to control the harmful effects of thermal expansion. Contact a plumbing service agency or your retail supplier regarding the installation of a thermal expansion tank.

STRANGE SOUNDS

Possible noises due to expansion and contraction of some metal parts during periods of heat-up and cool-down do not necessarily represent harmful or dangerous conditions.

OPERATIONAL CONDITIONS

WATER ODOR

In each water heater there is installed at least one anode rod (see parts sections) for corrosion protection of the tank. Certain water conditions will cause a reaction between this rod and the water. The most common complaint associated with the anode rod is one of a “rotten egg smell” in the hot water. This odor is derived from hydrogen sulfide gas dissolved in the water. The smell is the result of four factors which must all be present for the odor to develop:

A. A concentration of sulfate in the supply water.
B. Little or no dissolved oxygen in the water.
C. A sulfate reducing bacteria which has accumulated within the water heater (this harmless bacteria is nontoxic to humans).
D. An excess of active hydrogen in the tank. This is caused by the corrosion protective action of the anode.

Smelly water may be eliminated or reduced in some water heater models by replacing the anode(s) with one of less active material, and then chlorinating the water heater tank and all hot water lines. Contact the local water heater supplier or a qualified technician for further information concerning an Anode Replacement Kit and this chlorination treatment. If the smelly water persists after the anode replacement and chlorination treatment, we can only suggest that chlorination or aeration of the water supply be considered to eliminate the water problem.

Do not remove the anode leaving the tank unprotected. By doing so, all warranty on the water heater tank is voided.

HYDROGEN GAS

HYDROGEN GAS: Hydrogen gas can be produced in a hot water system that has not been used for a long period of time (generally two weeks or more). Hydrogen gas is extremely flammable and explosive. To prevent the possibility of injury under these conditions, we recommend the hot water faucet, located farthest away, be opened for several minutes before any electrical appliances which are connected to the hot water system are used (such as a dishwasher or washing machine). If hydrogen gas is present, there will probably be an unusual sound similar to air escaping through the pipe as the hot water faucet is opened. There must be no smoking or open flame near the faucet at the time it is open.

HIGH WATER TEMPERATURE SHUT OFF SYSTEM

A non-adjustable high temperature limit control operates before steam temperatures are reached. The high limit is in the same area as the upper thermostat and must be reset manually when it operates. BECAUSE THE HIGH LIMIT OPERATES ONLY WHEN ABNORMALLY HIGH WATER TEMPERATURES ARE PRESENT, IT IS IMPORTANT THAT A QUALIFIED SERVICE AGENT BE CONTACTED TO DETERMINE THE REASON FOR OPERATION BEFORE RESETTING.

• Turn off the heater electrical supply. Do not attempt to reset thermostat with power on.
• Remove the screw(s) securing the outer door and remove door.
• Remove or fold up the insulation to expose the reset button.
• Reset the high limit by pushing in the red button marked “RESET”.
• Replace the insulation so that it completely covers the thermostat and element.
• Replace the outer door.
• Turn “ON” electric power to the water heater.
TEMPERATURE-PRESSURE RELIEF VALVE OPERATION

The temperature-pressure relief valve must be manually operated at least once a year. When checking the temperature-pressure relief valve operation, make sure that (1) no one is in front of or around the outlet of the temperature-pressure relief valve discharge line, and (2) that the water discharge will not cause any property damage, as the water may be extremely hot. See Figure 21.

**DANGER**
- Burn hazard
- Hot water discharge.
- Keep clear of relief valve discharge outlet.

If after manually operating the valve, it fails to completely reset and continues to release water, immediately close the cold water inlet to the water heater, follow the draining instructions, and replace the temperature-pressure relief valve with a new one.

**FIGURE 22.**

Temperature-pressure relief valve on appliance weeps or discharges periodically, this may be due to thermal expansion. You may have a check valve installed in the water line or a water meter with a check valve. Consult your local water supplier or a qualified technician for further information. Do not plug or remove the temperature-pressure relief valve.

DRAINING

It is recommended that the tank be drained and flushed every 6 months to remove sediment which may build up during operation. The water heater should be drained if being shut down during freezing temperatures. To drain the tank, perform the following steps:

1. Turn off power to the water heater.
2. Open a nearby hot water faucet until the water is no longer hot.
3. Close the cold water inlet valve.
4. Connect a hose to the drain valve and terminate it to an adequate drain or external to the building.
5. Open the water heater drain valve and allow all of the water to drain from the tank. Flush the tank with water as needed to remove sediment.

6. Close the drain valve, refill the tank, and restart the heater as directed in this manual. CAUTION: Do not turn on power to the water heater unless it is completely filled with water.

If the water heater is going to be shut down for an extended period, the drain valve should be left open.

IMPORTANT: Condensation may occur when refilling the tank and should not be confused with a tank leak.

**THERMOSTAT REMOVAL / REPLACEMENT**

**WARNING**

- Before removing any access panels or servicing the water heater, make sure the electrical supply to the water heater is turned “OFF.”
- Failure to do this could result in death, serious bodily injury, or property damage.

1. Turn “OFF” the electric power supply to the water heater.

2. Remove the outer door. Remove or fold up the insulation pad.

3. **A. Models with lower thermostat without high limit:** Lift out the tab as shown below to unclip the terminal cover from the thermostat. The terminal cover can now be removed from the thermostat.

   ![FIGURE 23.](image)

4. Disconnect wires from thermostat and slide out of the bracket.

5. Remove the thermostat from behind the thermostat bracket.

6. Place the new lower thermostat in the bracket making sure it fits firmly against the tank.

7. Attach the wires to the new thermostat.

   NOTE: Some of the terminals may require straight-in wiring through an eye-opening. If wires are now looped, recut and strip wire 3/8” to a straight length and insert.

8. Put plastic terminal cover back in place.

9. Replace the insulation to cover the thermostat.

10. Replace outer door then turn the electric power on.

**ELEMENT CLEANING / REPLACEMENT**

NOTE: These instructions are written for element cleaning and element replacement for the lower element.

**WARNING**

- Before removing any access panels or servicing the water heater, make sure the electrical supply to the water heater is turned “OFF.”
- Failure to do this could result in death, serious bodily injury, or property damage.

To remove the element from the tank in order to clean or replace it:

1. Before beginning turn “OFF” the electric power supply to the water heater.

2. Turn off the water supply to the water heater at the water shut-off valve or water meter. See Figure 24.

   ![FIGURE 24.](image)

3. Attach a hose to the water heater drain valve and put the other end in a floor drain or outdoors. Open the water heater drain valve. Open a nearby hot water faucet which will relieve pressure in the water heater and speed draining.
The water passing out of the drain valve may be extremely hot. To avoid being scalded, make sure all connections are tight and that the water flow is directed away from any person.

4. Remove the screw securing the outer door, and remove door.

5. Fold back the insulation to expose the terminal cover.

6. A. **Models with lower thermostat without high limit:** Lift out the tab as shown below to unclip the terminal cover from the thermostat. The terminal cover can now be removed from the thermostat.

   B. **Models with Upper or Lower Thermostat with High Limit:** Lift out the tab as shown below to unclip the terminal cover from the thermostat. The terminal cover can now be removed from the thermostat.

7. Disconnect the two wires on the element and unscrew the old element from the tank.

8. Clean the area around the element opening. Remove any sediment in or around the element opening and inside the tank.

9. If you are cleaning the element you have removed, do so by scraping or soaking in vinegar or a deliming solution.

**NOTE:** Replacement elements must (1) be the same voltage and (2) no greater wattage than listed on the model rating plate affixed to the water heater.

10. A new gasket should be used in all cases to prevent a possible water leak. Place the new element gasket on the threaded side of the cleaned or new element and screw into tank, securing tightly using an element wrench.
11. Close the water heater drain valve by turning the handle to the right (clockwise). The drain valve is on the lower front of the water heater.

12. Open the cold water supply valve to the water heater.

   **NOTE:** The cold water supply valve must be left open when the water heater is in use.

13. To insure complete filling of the tank, allow air to exit by opening the nearest hot water faucet. Allow water to run until a constant flow is obtained. This will let air out of the water heater and the piping.

   **CAUTION**
   
   Improper installation and use may result in property damage.
   
   - Fill tank with water before operation.

   Never use this water heater unless it is completely full of water. To prevent damage to the tank and heating element, the tank must be filled with water. Water must flow from the hot water faucet before turning "ON" power. The manufacturer will not warrant any elements damaged by failure to follow instructions.

14. Check element for water leaks. If leakage occurs, tighten element or repeat Steps 2 and 3, remove element and reposition gasket. Then repeat Steps 10 through 14.

15. Reconnect the two wires to the element and then check to make sure the thermostat remains firmly against the surface of the tank.

16. Replace terminal cover on thermostat making sure the locking tabs on the terminal cover are in place.

17. Replace the insulation so that it completely covers the thermostat and element. See Figure 33.

18. Replace outer door.

19. Turn "ON" electric power to water heater.

---

**DRAIN VALVE WASHER REPLACEMENT**

(See Figure 34)

1. Follow "Draining" instructions.

2. Turning counter clockwise ( ), remove the hex cap below the screw handle.

3. Remove the washer and put the new one in place.

4. Screw the handle and cap assembly back into the drain valve and retighten using a wrench. **DO NOT OVER TIGHTEN.**

5. Follow instructions in the "Filling The Water Heater" section.

6. Check for leaks.

**SERVICE**

If a condition persists or you are uncertain about the operation of the water heater contact a qualified technician.

Use this guide to check a "Leaking" water heater. Many suspected "Leakers" are not leaking tanks. Often the source of the water can be found and corrected.

If you are not thoroughly familiar with your water heater and safety practices, contact a qualified technician to check the water heater.
LEAKAGE CHECKPOINTS

Read this manual first. Then before checking the water heater make sure the electrical power supply has been turned “OFF” before checking the tank for leakage.

*A. Condensation and dripping may be seen on pipes if the water temperature is low in humid weather or pipe connections may be leaking.

*B. The anode rod fitting may be leaking.

C. Small amounts of water from temperature-pressure relief valve may be due to thermal expansion or high water pressure in your area. If the valve is not piped to an open drain the released water could be mistaken for a leaking heater, see “Thermal Expansion” section.

*D. The temperature-pressure relief valve may be leaking at the tank fitting.

E. Water on the side of the tank may be condensation due to the panel or insulation not being in place.

F. Water from a drain valve may be due to the valve being slightly opened.

*G. The drain valve may be leaking at the tank fitting.

*H. Water in the water heater bottom or on the floor may be from condensation, loose connections, or the relief valve. DO NOT replace the water heater until a full inspection of all possible water sources is made and necessary corrective steps taken.

Leakage from other appliances, water lines, or ground seepage should also be checked.

* To check where threaded portion enters tank, insert cotton swab between jacket opening and fitting. If cotton is wet, follow “Draining” instructions in the “Periodic Maintenance” section and then remove fitting. Put pipe dope or teflon tape on the threads and replace. Then follow “Filling the Water Heater” instructions in the “Installing the New Water Heater” section.
**TROUBLESHOOTING GUIDELINES**

These guidelines should be utilized by a qualified technician.

* If Applicable  
** Not Illustrated

Now that you have purchased this water heater, should a need ever exist for repair parts or service, simply contact the company it was purchased from or the manufacturer listed on the rating plate on the water heater.

Be sure to provide all pertinent facts when you call or visit.

Selling prices will be furnished on request or parts will be shipped at prevailing prices and you will be billed accordingly.

The model number of your Water Heater will be found on the rating plate located above or adjacent to outer door.

WHEN ORDERING REPAIR PARTS, ALWAYS GIVE THE FOLLOWING INFORMATION:

- MODEL NUMBER  
- SERIAL NUMBER  
- VOLTAGE AND ELEMENT WATTAGE  
- PART DESCRIPTION

THIS IS A REPAIR PARTS LIST, NOT A PACKING LIST.
When ordering repair parts, always give the following information:

- PART DESCRIPTION

**THIS IS A REPAIR PARTS LIST, NOT A PACKING LIST.**
THIS WARRANTY IS APPLICABLE TO THE ORIGINAL OWNER ONLY. In accordance with the warranty terms and conditions specified below.

Reliance Water Heaters (the warrantor) will furnish the ORIGINAL OWNER, 1) a replacement Reliance water heater of equivalent size and current model if the glass-lined tank in this water heater leaks and, 2) a replacement part for any component part which fails. Sacrificial anode rods are consumable maintenance parts and are excluded from warranty coverage.

THE RELIANCE WATER HEATERS REPLACEMENT MODEL OR PART WILL BE WARRANTED FOR ONLY THE UNEXPIRED PORTION OF THE ORIGINAL WARRANTY. The warranty period will be determined by the original date of purchase of the water heater, or in the absence of a Bill of Sale verifying said date, from the date of manufacture indicated on rating plate affixed to this water heater. This warranty is not transferrable and applies to models listed below:

When the water heater has been used for other than single family residential application:

1. The tank warranty shall be reduced to 3 years for Lifetime, 9 and 12 years and to 1 year for 6 year models.
2. The parts warranty shall be reduced to 3 years for Lifetime models and 1 year for all other models.

CONDITIONS AND EXCEPTIONS

This warranty shall apply only when the heater is:
- owned by the original purchaser;
- installed for indoor operation only;
- used at temperatures not exceeding the maximum calibrated setting of its thermostat;
- used at water pressure not exceeding the working pressure shown on the heater;
- filled with potable water, free to circulate at all times and with the tank free of damaging water sediment or scale deposits;
- used in a non-corrosive and non-contaminated atmosphere;
- used with factory approved anode(s) installed;
- in its original installation location;
- in the United States, its territories or possessions, and Canada;
- sized in accordance with proper sizing techniques for residential water heaters;
- bearing a rating plate which has not been altered, defaced or removed except as required by the warrantor;
- used in an open system or in a closed system with a properly sized and installed thermal expansion tank;
- connected to the proper voltage or:
- operated at the factory rated input;
- installed with no attempted, nor actual modification or alteration of the water heater’s design in any way, including but not limited to, the attachment of non-company approved appliances or equipment, including any additional aftermarket equipment introduced into the sealed system.

Any accident to the water heater or any part thereof (including freezing, fire, floods, or lightning), any misuse, abuse or alteration of it, any operation of it in a modified form, any operation of the water heater on desalinated (deionized) water, or any damage caused by attempts to repair tank leaks or parts, will void this warranty. This warranty does not cover water heaters replaced for cosmetic reasons or for reasons of noise, taste, odor, discolored and/or rusty water. This warranty does not apply to water heaters used to heat pools, whirlpools or hot tubs or used for space heating where its sizing does not conform with specifications of the heating component manufacturer.

This warranty gives you specific legal rights, and you may have other rights which vary under the laws of each state. If any provision of this warranty is prohibited or invalid under applicable state law, that provision shall be ineffective to the extent of the prohibition or invalidity without invalidating the remainder of the affected provision or the other provisions of this warranty.
DISCLAIMERS

NO EXPRESSED WARRANTY HAS BEEN OR WILL BE MADE IN BEHALF OF THE WARRANTOR WITH RESPECT TO THE MERCHANTABILITY OF THE HEATER OR THE INSTALLATION, OPERATION, REPAIR OR REPLACEMENT OF THE HEATER OR PARTS. THE WARRANTOR SHALL NOT BE RESPONSIBLE FOR WATER DAMAGE, LOSS OF USE OF THE UNIT, INCONVENIENCE, LOSS OR DAMAGE TO PERSONAL PROPERTY, OR OTHER CONSEQUENTIAL DAMAGE. THE WARRANTOR SHALL NOT BE LIABLE BY VIRTUE OF THIS WARRANTY OR OTHERWISE FOR DAMAGE TO ANY PERSONS OR PROPERTY, WHETHER DIRECT OR INDIRECT, AND WHETHER ARISING IN CONTRACT OR IN TORT.

Should governmental regulations or industry standards prohibit the Manufacturer from furnishing a comparable model replacement under this warranty, the Owner will be furnished with the closest comparable water heater meeting the then current governmental regulations and industry standards. A supplementary fee may be assessed to cover the additional cost associated with the changes made to meet applicable regulations and standards. The limited warranty is voided if the maintenance procedures listed in the owner's instruction manual are not followed.
